Circuits And Circuit Elements Problem Circuits and Circuit Elements Problem C - Mr. Loyacano Circuits. Power in circuits ($P = VI$, $P = I^2 R$) $P = IV = I^2 R$ P is power, I is current, V is voltage, R is resistance. Power companies try to save the amount of copper needed for power lines by using thinner wires, which makes R quite high.

This too is a circuit design problem and not a PCB problem. In circuit design, we need to make sure that the components selected are within design constraints. When signals exceed the frequency limits of analog circuitry, the output signal will also be attenuated, and distortion will result if the sine wave begins to look like a triangle wave at the output of the frequency-limited component.
