Secure Solutions, Inc. was tasked by the Space and Naval Warfare Systems Command (SPAWAR) to perform a Small Business Innovation Research (SBIR) Phase II network security research effort consisting of a series of analyses that extend the Phase I effort. This Final Report summarizes the results of those analyses. The Phase II effort consisted of the following tasks: Task 1 - Demonstration of Phase I Concept, Task 2 - Navy Security Standards and Applications Analysis, Task 3 - Analysis of End-to-End Encryption and Traffic Flow Confidentiality Options, Task 4 - Naval Network Security Requirements Analysis, Task 5 - NetWare Administrator's Security Guidance Handbook, Task 7- Participate in Security Groups. In response to changing needs of the Navy, Phase II was redirected from a technical perspective with a focus on communications security technology to a "hands-on" perspective with a focus on network security Administration. The Novell NetWare Security Administrator's Security Guidance Handbook was the result of that redirection. The importance of this redirection has been recognized and will be carried into Phase III with the development of a comprehensive set of network security administration tools. In addition, the scope will be broadened to include support of Microsoft Windows NT security administrators as well. (AN)

Secure data science, which integrates cyber security and data science, is becoming one of the critical areas in both cyber security and data science. This is because the novel data science techniques being developed have applications in solving such cyber security problems as intrusion detection, malware analysis, and insider threat detection. However, the data science techniques being applied not only for cyber security but also for every application area—including healthcare, finance, manufacturing, and marketing—could be attacked by malware. Furthermore, due to the power of data science, it is now possible to infer highly private and sensitive information from public data, which could result in the violation of individual privacy. This is the first such book that provides a comprehensive overview of integrating both cyber security and data science and discusses both theory and practice in secure data science. After an overview of security and privacy for big data services as well as cloud computing, this book describes applications of data science for cyber security applications. It also discusses such applications of data science as malware analysis and insider threat detection. Then this book addresses trends in adversarial machine learning and provides solutions to the attacks on the data science techniques. In particular, it discusses some emerging trends in carrying out trustworthy analytics so that the analytics techniques can be secured against malicious attacks. Then it focuses on the privacy threats due to the collection of massive amounts of data and potential solutions. Following a discussion on the integration of services computing, including cloud-based services for secure data science, it looks at applications of secure data science to information sharing and social media. This book is a useful resource for researchers, software developers, educators, and managers who want to understand both the high level concepts and the technical details on the design and implementation of secure data science-based systems. It can also be used as a reference book for a graduate course in secure data science. Furthermore, this book provides numerous references that would be helpful for the reader to get more details about secure data science.
