Statistical inference is the process of drawing conclusions about

populations or scientific truths from data. There are many modes of performing inference including statistical modeling, data oriented strategies and explicit use of designs and randomization in analyses. Furthermore,

Read Free Statistical

there are broad theories (frequentists, Bayesian, likelihood, design based, ...) and numerous complexities (missing data, observed and unobserved confounding, biases) for performing inference.

Statistical Inference | Coursera

In this course we limit ourselves to the

Read Free Statistical

parametric inference.

Parametric inference is a special case of the statistical inference

where it is assumed that the functional form of the joint distribution of the random vector Y is fixed up to the value of the parameter vector $\theta = (\theta_1, \dots, \theta_d)$ living in some parameter space Θ .
