Joe Muscolino ' s The Muscular System Manual: The Skeletal Muscles of the Human Body, 4th Edition is an atlas of the muscles of the human body. This approachable, yet detailed, musculoskeletal anatomy manual provides both beginner and advanced students with a thorough understanding of skeletal muscles in a compartmentalized, customizable layout. Each muscle spread shows the individual muscle drawn over a photo of the human body, with an arrow to indicate the line of pull of the muscle, and explains: the muscle name, the origin of that name, Greek and Latin derivations, pronunciation, attachments, actions, eccentric contraction function, isometric contraction function, innervation to two levels of detail with predominant levels in bold, and arterial supply to two levels of detail. This new edition also features robust Evolve resources: an updated art program, and new chapter review and critical thinking questions that encourage you to apply what you have learned to prepare for practice. UNIQUE! Overlay art, consisting of over 380 full-color anatomical illustrations of muscles, bones, and ligaments drawn over photographs, helps identify the positions of muscles and bones in the human body. UNIQUE! Electronic Muscle and Bone Review Program features a base photograph with a skeleton drawn in and a list of every muscle for each major region of the body so students can choose any combination of muscles and place them onto the illustration — allowing them to see not only the muscle attachments, but also the relationship among the muscles of the region. Complete muscle coverage in an easy-to-understand layout makes this text appropriate for novices to anatomy, as well as intermediate and advanced students. Content organized by body region and includes information on how muscles in that region function together and large drawings of the muscles of that region so you can go directly to the topic you are studying. Covers the methodology for each muscle with information for learning muscle actions to explain the reasoning behind each action — and encourage you to learn and not just memorize. A four-color, student-friendly design with sections clearly boxed throughout and checkboxes that help you keep track of what you need to learn and what you have mastered. Customizable format, with checkboxes and numbered lists in each muscle layout, presents basic muscle information for the beginning student in bold type and more advanced information in regular type. Palpation boxes include bulleted steps instructing how to palpate each muscle so you can apply this assessment skill in practice. Evolve website for instructors includes TEACH Resources, a Test Bank, and an image collection so instructors can easily access all of the materials they need to teach their course in one place — and track through the course management system provided via Evolve. Evolve website for students includes access to audio of the author reading aloud muscle names, attachments, and actions for the muscles covered in the book, labeling exercises, and more to enrich your learning experience.

Muscle and Meat Biochemistry teaches the different concepts and topics under the eponymous subject. The book covers the gross and detailed composition and structure of muscles and the relationship of the nervous system with the muscular system; muscle cell differentiation and growth; proteins of the thick filament; and the molecular structure and enzymatic activity of myosin. The text also discusses the proteins found in the thin filament - actin, troponin, and myosin; skeletal muscle growth; protein metabolism; and fiber types. The book also encompasses cardiac and smooth muscle; sarcoplasmic proteins; the connective tissues - collagen, elastin, and ground substance; and the postmortem changes during conversion of muscle to meat. The text is recommended for advanced undergraduate and graduate students, as well as for scientists who would like to know more about muscle biology, muscle physiology, and meat science.

Biology of Bats, Volume 1, examines most of the basic characteristics related to the anatomy, physiology, behavior, and ecology of the bat. It covers the animal's evolution, as well as karyology, bioeconomics, zoogeography, principles of classification, and procedures and issues involved in the care and management of bats as research subjects in the laboratory. Organized into 10 chapters, this volume begins with a historical overview of bat origins and evolution, karyotypic trends in bats, and the role of karyotypes in studying the biology of bats. It then discusses the bat skeletal and muscular systems; flight patterns and aerodynamics; prenatal and postnatal development; migration and homing; ecology and physiological ecology of bat hibernation; thermoregulation and metabolism; and the urinary system, including gross anatomy and embryology, histophysiology, and renal physiology. It also looks at morphological contrasts between the skulls and dentitions of different families and genera of bats. This book will benefit biologists, zoologists, teachers, and others concerned with the general biology of Chiroptera.
