The transmission line is a conductor or wire which is designed to carry electrical energy below microwave range from one place to another. Transmission lines are two or more conductors separated by some insulating medium (two-wire, coaxial, microstrip, etc). Circuit theory is considered in transmission line. Power handling capacity is low.

- Transmission lines and waveguides are utilized to transfer electromagnetic waves carrying energy and information from a source to a receiver - Choice of the line technology depends on the purpose, e.g. operating frequency range, the transmitted power level, and what power losses one can tolerate - For an efficient transport one likes to guide the energy inside a line instead of spreading it out in space

Waveguides Waveguides Waveguides, like transmission lines, are structures used to guide electromagnetic waves from point to point. However, the fundamental characteristics of waveguide and transmission line waves (modes) are quite different. The differences in these modes result from the basic differences in geometry for a transmission line and a waveguide. Waveguides can be generally classified as either metal waveguides or dielectric waveguides. Metal waveguides normally take the form of

3. Must operate the waveguide at a frequency above the respective TE or TM mode cutoff frequency for that mode to propagate. 4. Lower signal attenuation at high frequencies than transmission lines. 5. Metal waveguides can transmit high power levels. The fields of the propagating wave are spread

Definition: Waveguides are a special category of transmission line that is used to guide (direct) the waves (radiation) along the length of the tube. These are typically hollow metallic tube which acts as the medium to transfer or transmit the power. In waveguides, the energy is propagated through a tube.

The main difference between the operation of transmission lines and waveguides is that a. the latter are not distributed, like transmission lines b. the former can use stubs and quarter-wave transformers, unlike the latter c. transmission lines use the principal mode of propagation, and therefore do not suffer from low-frequency cut-off
